Cemented Tungsten Carbides Production Properties

The advent of cemented carbides or hard metals began with the idea of replacing costly diamond wire drawing dies for tungsten filaments. This group of sintered materials (WC-Co) had outstanding properties of high levels of hardness and wear resistance. After the application of cemented carbides in drawing dies, attention was drawn to better cutting tools and finally to a variety of wear parts and machine components.

Cemented carbide is a hard material used extensively as cutting tool material, as well as other industrial applications. It consists of fine particles of carbide cemented into a composite by a binder metal. Cemented carbides commonly use tungsten carbide, titanium carbide, or tantalum carbide as the aggregate. Mentions of "carbide" or "tungsten carbide" in industrial contexts usually refer to these cemented composites. Most of the time, carbide cutters will leave a better surface finish on the p

Cemented carbide - Wikipedia

(PDF) Process development and scale up of cemented carbide ...

Tungsten carbide, typically in the form of a cemented carbide (carbide particles brazed together by metal), has become a popular material in the bridal jewelry industry due to its extreme hardness and high resistance to scratching.

Tungsten carbide - Wikipedia

Cemented carbides or hard metals are among the most critical materials in engineering industries. They provide the majority of turning tools and milling cutters and mining tools, apart from wear resistant structural parts. The author of the present book for quite some time felt the need for a book on tungsten carbide based hard metals in order to cover processing, microstructure, and properties.

Cemented Tungsten Carbides: Production, Properties, and ...

The excellent mechanical and outstanding tribological properties of cemented carbides are mainly determined by a network microstructure of two different phases, i.e. hard grains of brittle carbides and soft phase of ductile binder.

Application of Cemented Carbide in Tool and Die Production (1) In the field of cutting tools, cemented carbide maintains excellent cutting performance even at high temperatures of 800-1000°C. It is suitable for rapid cutting at high temperatures and has practical significance for improving economic efficiency.

Heat Treatment of Tungsten Carbide Products - Meetyou Carbide

The very thin cobalt film (between 100 and 300 nm) grows brittle, as the movement of dislocations within the film is confined, and the growth of microcracks is not arrested [9]. Mechanical properties which are evaluated in cemented carbides include flexural strength, compressive strength and fracture toughness.

Properties and Testing of Cemented Carbides | IntechOpen

The first cemented carbide developed was tungsten carbide (introduced in 1927) which uses tungsten carbide particles held together by a cobalt metal binder. Since then other cemented carbides have been developed, such as titanium carbide , which is better suited for cutting steel, and tantalum carbide , which is tougher than tungsten carbide.
